#### 2 Warranty and Safety

#### Limited After-Sales Warranty 2.1

Xi'an ACTIONPOWER Electric Co., Ltd. is responsible for free maintenance of the PRE20XXS series products manufactured and sold within 12 months from the date of delivery for any failure or damage under normal use.

During the guarantee period, the Company shall not be liable for free repair for any of the following circumstances, and the Company shall charge according to the repair conditions after repair:

Products not directly sold by our company or agents not officially authorized by our company.

Failure or damage caused by irresistible catastrophes, or failure to use in accordance with the User's Manual or fault of the user, such as improper operation or other disposal.

Disassemble, repair, refit or install accessories without the consent of our company, resulting in failure or damage.

During the warranty period, the user is responsible for transporting the faulty or damaged products to the Company at their own expense, and the Company is responsible for transporting the repaired products to the user (mainland China only) or its designated location (mainland China only).

This "Warranty" excludes all other express or implied warranties.

#### 2.2 Safety

ACTION

Do not make any unauthorized modifications, or install or replace any parts. Please return the product to the Company's maintenance department if maintenance is necessary, to maintain its safety features.

Please refer to the specific warnings or precautions in the user manual to avoid personal injury or product damage.

#### Safety Rules 2.3

In order to prevent electric shock, it is strictly prohibited to disassemble this product unless it is authorized by the Company.

This product must not be used on any equipment that has safety requirements, including life support systems. INDNPOWER

※言和言

IONPOWER

We disclaim all liability for any direct or indirect financial losses resulting from the use of this product.

# 2.4 Meaning of Safety Signs

### Warning:

Cautionary statement, which indicates conditions and precautions that may endanger the life of the operator.

### Caution:

Precautionary statement, which indicates that damage may be caused to the product or to other equipment connected to the product.

## 2.5 Safety Information

This section contains important information that should be read before attempting to install and start the PRE20XXS family of products and is intended for use by experienced operators. Experienced operators should understand and be familiar with the importance of life safety and other safety issues. This section mainly includes:

- Safety precautions;
- Warning;
- Caution;
- Installation preparation;
- Installation instructions;

Be sure to familiarize yourself with the safety symbols shown on this page. These symbols are used throughout this manual and include important information and related issues affecting the safety of the end user or operator.

|                  | 一下和意情  | SZ FILLE IS   |
|------------------|--|---------------|
| $( \downarrow )$ | Protective earth identification (equivalent to " | PE" symbol)   |
| 0                | Disconnect the power supply                      | 一道            |
| 3~               | Three-phase AC                                   | EFF           |
| 5                | AC   | ACTION        |
| 1                | On (power on)                                    | 一百萬團          |

| $\geq$           | AC and DC  | AV            |

Warning: High voltage hazard/electric shock hazard.

CAUTION: When you see this warning symbol, be sure to refer to this manual to familiarize yourself with the nature of potential hazards and measures to avoid them.

## 2.6 Safety Precautions

The following general safety precautions must be observed during all phases of operation, maintenance and repair of this product. Violation with safety standards for design, manufacture, and intended use of the product caused by failure to observe these precautions or specific warnings elsewhere in this manual. Xi'an ACTIONPOWER Electric Co., Ltd. shall not be liable for any failure of the customer to comply with these requirements.

With a protective grounding terminal, this product is Class I safety equipment. The protective function of this product could be harmed if it is used contrary to the instructions.

### Warning: Ambient conditions.

This product is only suitable for installation in an indoor environment with pollution level 2, altitude not exceeding 2000m, overvoltage level OVCII and without direct sunlight, dust, flammable and explosive gases and strong magnetic fields. The operating temperature range is  $0 \sim 50^{\circ}$ C and the relative humidity is less than 80%.

#### Note: Before power-on.

Confirm that the AC input specifications of the product indicated on the nameplate match the parameters such as voltage and frequency of the available common circuit.

### Safety precautions: grounding,

With a protective grounding terminal, this product is Class I safety equipment. In order to reduce the risk of electric shock, the enclosure grounding terminal of this product must be connected to the electrical safety ground. This product must be connected to the AC power supply through a suitably rated three-phase cable (L1-L2-L3-PE) with protective earthing.

Disconnecting the protective (grounding) conductor or protective earthing terminal could result in an electric shock hazard that could be harmful to people.

This product is equipped with line filters to reduce electromagnetic interference and must be properly grounded to minimize the risk of electric shock. Leakage currents greater than 5.0 mApeak may occur during operation at line ICI5315

voltages or frequencies that are higher than those listed on the model plate.

### Warning: Avoid operating in an explosive environment.

Do not operate this product in flammable or explosive atmospheres.

#### WARNING: Disconnect the device.

A disconnecting device (external switch or circuit breaker) must be a part of the installation for the AC input connection. The disconnecting device must be located in an easily accessible position and must be marked as the disconnecting device for this product. All conductors must be simultaneously disconnected by the disconnecting device.

ACTION

It is necessary to provide external overcurrent protection devices (fuses, circuit breakers, and so on).

The overcurrent protection device's breaking capacity must be appropriate for the rated current of the device.

On the supply side of the overcurrent protective device, there must be at least minimal insulation between supply connection components with opposing polarities.

Protective conductors cannot have overcurrent protective devices installed in them. The neutral conductor of multi-phase equipment must be installed in accordance with GB19517-2009, without fuses or single-pole circuit breakers.

Before touching the equipment or any terminal block or pin, after cutting off the mains power, make sure to check any residual DC voltage from each line terminal to the grounding stud as shown in Figure 1 using the DC position of the digital multimeter (DMM) to detect the safety voltages (< 5Vdc).

米宕和夏

2.言利語|

Figure 1 Schematic Diagram of Residual Voltage Check of AC Input Filter After Disconnecting AC Power

### WARNING: Do not replace parts or modify.

Due to the risk of introducing additional hazards, do not install replacement parts or make any unauthorized modifications to this product. This product should be mailed back to the Sales Service Department of Xi'an ACTIONPOWER Electric Co., Ltd. for service and repair to ensure that this product is properly maintained.

Damaged or defective products shall be taken out of service and affixed with a similar "Faulty/To be repaired" sign to prevent accidental operation until they are repaired by professional service personnel.

### NOTE: Instrument position.

Do not place the instrument in any position that prevents easy access to the power disconnecting means or in any manner that makes it difficult to operate the power disconnecting means.

Note: Please keep the product surface clean and dry.

Note: Do not place heavy objects on the product shell.

Caution: Avoid damage to the machine due to severe impact or improper handling.

Note: Rear, front and side plates' vents should not be blocked.

WARNING: To prevent fire, only fuses of the specification specified for this product are permitted.

#### Caution: Maintain cleanliness.

Electric shock could occur if this product were to be maintained and cleaned while it live. Do not directly spray the detergent on the soft cloth; rather, dampen it with water and mild detergent. Avoid using chemicals or detergents that contain abrasive substances such as benzene, toluene, xylene and acetone.

Non-professionals should not repair and maintain this product, otherwise it will cause personal injury or product damage.

ACTION

2. 岩和富

This chapter mainly describes the general operating characteristics of the PRE20XXS series bidirectional AC programmable power supplies. ACTION

#### **General Description** 3.1

PRE20XXS series bidirectional AC programmable power supply leads the development direction of a new generation of AC power supply. It has extremely high power density and can achieve rated output power of 20kVA in 3U volume. The whole system is equipped with matrix parallel function, and the parallel expansion can be up to 200kVA to provide greater output power to meet the test requirements. The independent high-precision measurement system has good industry load adaptability and raises the output index to a new height, making the application test more accurate and convenient.

The PRE20XXS series products have four-quadrant working capability, which can meet the general grid simulation regulation test. The unique RLC mode can meet the grid adaptability, island and off-grid operation test of all green energy-related industries, such as PV grid-connected inverter, energy storage system ESS/PCS, microgrid, on-board charger OBC/BOBC, uninterruptible power supply UPS and other products.

Small signal bandwidth up to 10kHz, analog output capability, very low latency and optimization specifically for hardware-in-the-loop simulation (PHIL) capabilities.

The PRE20XXS series products provide accurate, stable, clean AC or DC power, either by operating the front panel display or by remote operation using LAN, USB, analog interfaces for standard testing, automatic testing and more functions.

PRE20XXS series products have built-in five programming functions of List, Wave, Step, Pulse and Advanced, and two harmonic parameter setting functions of harmonic and interharmonic, and support steady-state output functions such as sine wave, pulse wave, triangular wave, leading edge half wave, trailing edge half wave, 30 built-in harmonics and custom wave. It also has waveform point editing function and supports import/export of external USB storage ACTIONPOWER

※言和夏

#### devices.

## 3.2 **Product Features**

The following features apply to all PRE20XXS series products.

Source/load integration, full power feedback, full power four-quadrant load;

Small signal bandwidth up to 10kHz, large signal bandwidth 2000Hz, optimized for hardware-in-the-loop simulation (PHIL) functions;

High power density 3U up to 20kVA, standard 19-inch cabinet capacity configurable200kVA;

3 phases can be linked, independent and parallel, with  $0 - 450V_{@L-N}$  output capacity;

High precision output and measurement,  $0.01\% \pm 0.05\% F.S$  voltage precision and  $0.1\% \pm 0.1\% F.S$  current precision;

Frequency range of output fundamental wave0.01 - 200Hz;

Harmonic expansion to 100 times@40Hz - 70Hz;

Constant power curve output, no need to set high and low voltage gears;

Up to 12 RLC network topology simulation functions;

USB and Ethernet interfaces compatible with SCPI and Modbus communication protocols;

Based on the advanced power conversion technology of PRE20XXS series products, when the product output is connected to energy feedback loads, such as motors, inverters, etc., it can work in four-quadrant state without adding a discharge circuit.

## 3.3 Function Block Diagram

The PRE20XXS series products use full high frequency devices to raise performance indicators to a whole new height. Figure 2 shows the internal function diagram of the PRE20XXS series products.

※ 言相意

The operation and setting parameters such as voltage, current and frequency of PRE20XXS series products can be **《岩市日月日** ACTIONPOWER ACTION

※完計調問

read and set through the display screen or communication port.

PRE20XXS series products are internally designed with a high precision synchronous measuring system, which has been calibrated at the factory and complies with the specifications. They can be used in general applications without the need for additional instruments. Detailed data content and precision can be found in 4.2.

### 3.5 Accessories

Each qualified PRE20XXS series product includes the accessories listed in Table 1. If one or more accessories are found to be incorrect or missing, please contact the manufacturer for after-sales service.

# 4 TECHNICAL SPECIFICATIONS

The relevant performance indicators in the technical specifications of this chapter are applicable to the ambient temperature of 0~50°C and the altitude shall not exceed 2000m.

## 4.1 Product model

There are 6 models available for PRE20XXS series products, with a power range of  $6kVA \sim 20kVA$ . See or detailed product models.

Table 2 Model List of PRE20XS Series Products

## 4.2 TECHNICAL SPECIFICATIONS

Table 3 briefly lists the data under rated input and resistive load conditions with ambient temperature of 25°C±5°C, which can meet the general selection reference. For other influencing conditions, refer to 4.4-4.13.

#### Notes:

- 1) F.S. in the parameter table related to AC output voltage refers to the maximum AC voltage of 450V;
- 2) The DC component is set as output voltage 220VAC and frequency 50Hz, tested under no load;
- 3) When the output frequency is ≤200Hz, the maximum distortion is tested under 250VAC and the pure resistive load to the rated output power;
- 4) When the resolution is 0.001 or 0.01% of the current setting value, whichever is greater;
- 5) The phase precision is set to 220V for the three-phase output voltage, and the three-phase phase is set to the default phase. The test is conducted under no load;
- 6) 40% of the amplitude of 300V\_rms refers to the total content of superimposed harmonics;
- 7) Peak factor refers to the ratio of peak current to effective value. The typical value of standard sine wave is 1.414, and the maximum allowable value is 6, but the peak value does not exceed the maximum current value of a single machine, and does not refer to the peak factor under rated values;

※ 言記 Ellow Powe

8) F.S. in the parameter table related to AC current refers to the maximum current of the corresponding model;

- 10) In the parameters table, the FS related to DC output voltage refers to the maximum DC voltage of 636V;
- 11) The output ripple voltage is 500V for the output DC voltage, and the output is under no load. The oscilloscope is AC coupled with 20MHz bandwidth limit;

ACTION

- The FS of active power and apparent power precision refers to the maximum measured power value of the machine of the corresponding model;
- 13) The input voltage 304-323V needs to be derated by 60%, and the input voltage 323-342V needs to be derated by 80%. See Figure 5 for detailed derating requirements;
- 14) Power factor and efficiency index are tested under the three-phase input voltage of 380V, the set output of 220V, pure resistive load to the rated output power.

## 4.3 Overall dimensions

The PRE20XXS series products are standard 19-inch chassis construction. See Figure 3 for overall dimensions. It can be applied to standard cabinet systems or desktops.

Figure 3 Overall Dimensions of PRE20XXS Series Bidirectional AC programmable Power Supply

ACTION

### 4.4 Output voltage vs. current curve

Conventional AC supply voltage output ranges have two gears to provide either high voltage or high current. The PRE20XXS series is designed with a unique single voltage range operating along a constant power curve. The constant output power curve is shown in Figure 4. Taking PRE2020S as an example, the rated power can be output at L-N/190 *Vac*@35 *A*, and this operating state range can be extended to L-N/450 *Vac*@15 *A* output without interruption. When other power supplies switch in the high and low voltage range, it will cause output disconnection and EUT power failure, which is difficult to test AC products with wide voltage input.

Figure 4 Output Voltage and Output Current Curve of PRE20XXS Series Products in AC Constant Power Mode

| 电流/Arms Current/Arms Current/Arms Voltage/Urms | 交流恒功率曲线 | AC constant power curve |   |
|--|---------|-------------------------|---|
| 电压/Urms Voltage/Urms                           | 电流/Arms | Current/Arms            |   |
|  | 电压/Urms | Voltage/Urms            | ā |

Notes:

The output voltage range is determined by a number of constraints, for example, the output voltage and output power are affected to varying degrees at different output frequencies, as detailed in Section 4.4-4.8.

This feature also applies to the DC output mode. General AC programmable power supply, its output current will be 1/2 of the AC effective value when outputting DC mode. The PRE20XXS series products benefit from advanced power conversion technology. When DC mode output is selected, the average value of the maximum output current is equal to the AC effective value, and it can operate in a four-quadrant state. Figure 5 shows the four-quadrant voltage-current relationship in DC mode.

| <mark>电压/Urms</mark> | ACTION       | Voltage/Urms                          | A    |

※ 完計算信

The PRE20XXS series products can provide up to 3 independent outputs in DC output mode. Positive, ground and negative three-wire DC output can be achieved by simple connection, e.g. producing ±270V output for aviation test systems. Fully adaptable to 100% unbalanced loads. One output can also be realized in parallel to provide 3 times the current.

The maximum output range of PRE20XXS series products can reach L-N/450 Vac and L-L/0-779 Vac at 40Hz-70Hz, which can meet the test requirements of 660 and 690 systems.

ACTION

\* 言記言

The maximum output frequency of the PRE20XXS series products is 200Hz, and full power output is available in the full frequency range. The voltage, frequency and output power curves of the PRE20XXS series products are shown in Figure 6 to Figure 11.

Figure 11 Curve of Single-phase Output Voltage and Output Power in PRE2020S Three-phase Mode

## 4.6 Output voltage THD and power

At steady-state output, the change of resistive load power will affect the THD index of output voltage. It is shown that PRE20XXS series products have good THD at light load. With the increase of load power, the THD value will increase, but it will not exceed the nominal value in the specification table.

# 4.7 Output voltage THD versus frequency curve

PRE20XXS series products have good THD characteristics in the full frequency range, which can meet most test requirements. Affected by limiting parameters, the output THD value will increase with the increase of output frequency. The output curve is shown in Figure 12.

# 4.8 Output voltage precision and frequency

※言語意思 ACTIONPOWER

PRE20XXS series products adopt high-speed and high-precision asynchronous sampling technology, which can maintain high voltage precision in a large output range. When the output voltage is greater than 10V, the output voltage precision is less than the values indicated in the specification table.

## 4.9 Relationship curve between single harmonic content and superposition

※言相意!!

※言記意應 ACTIONPOWER

### number

The PRE20XXS series products have a wide harmonic generation capability. The harmonic frequency can reach 100 times at the fundamental frequency of 40Hz~70Hz, and the harmonic frequency can reach 25 times at 200Hz. See Figure 13 for the relationship between the single harmonic content and the number of superpositions under the conditions of 40Hz-70Hz.

## 4.10 Input voltage versus output power derating curve

The PRE20XXS series adopts an advanced power conversion topology, which broadens the input voltage range to L-L/(304-480) to meet more demanding environmental requirements. Vac Vac However, when the input voltage is low, A AC the output power is derated, and the derating curve is shown in Figure 15.

### 4.11 Output overcurrent protection delay curve

PRE20XXS series products are equipped with a relatively complete protection system, especially for various protections of loads, which can be adjusted by users as required, but the maximum limit is reserved for each item. In order to effectively prevent the misoperation of the protection device when the PRE20XXS series products are connected with impact load, the overcurrent protection delay time can be adjusted in a wide range, and the maximum setting area is shown in Figure 16. See Section 8.8 for setting operations.

## 4.12 Environmental conditions

In order to ensure the good performance of PRE20XXS series products and guarantee its working life, the use environment shall not exceed the following limiting conditions. The environmental conditions are shown in Table 4. Table 4 Environmental Conditions of PRE20XS Series Products

| Working environment   | X PETIDNPLU                           |          | A           |    |

## 4.13 Output derating and ambient temperature curve

General electronic product development laboratories or production lines can ensure a good temperature environment, and PRE20XXS series products can ensure good performance under these environmental conditions. When the ambient temperature rises, the output power of the PRE20XXS series products will decrease until the overtemperature protection. The output power derating and temperature curves are shown in Figure 17.

## 4.14 Audio noise and ambient temperature

The PRE20XXS series products will generate audio noise of fan noise and fundamental noise when they work. Only ACTIONPOWE ACTIONPOWER

※言和意

fan noise is calculated during audio noise test. The PRE20XXS series products are equipped with intelligent speed regulating fans, which can effectively reduce the audio noise at low ambient temperatures.

## 4.15 Audio noise versus output power curve

The PRE20XXS series products will generate audio noise of fan noise and fundamental noise when they work. Only fan noise is calculated during audio noise test. The PRE20XXS series products are equipped with intelligent speed regulating fan, which can effectively reduce the audio noise at low output power. As the output power increases, the fan noise also increases, and the relationship curve between the two is shown in Figure 18.

## 4.16 Audio noise and output frequency

PRE20XXS series products can output fundamental waves of 200Hz and harmonics of 100 times @40Hz-70Hz ACTIONPOWER

and 25 times @200*Hz*. When working under these conditions, the power supply will produce audio noise that can be felt by human ears. Due to individual differences, different sensations will be felt under the same conditions. It is recommended that sensitive people take protective measures to protect their hearing.

# **5** Unpacking and Installation

## 5.1 Inspection

Please carefully check the completeness of the packaging before unpacking. If there is any abnormality or you think it may cause damage to the product, please contact Xi'an ACTIONPOWER Electric Co., Ltd. for the after-sales service immediately.

After unpacking, please carefully check the appearance of the product and the quantity of accessories according to the packing list. If there is any abnormality, please contact Xi'an ACTIONPOWER Electric Co., Ltd. for the after-sales service immediately.

All PRE20XXS Series models require a three-phase AC input and are equipped with a pluggable terminal block.

※言相意

The packaging of PRE20XXS series products is shown in Figure 19. According to the safety regulations, the weight of this series of products is more than 18kg (about 35kg). Before unpacking, the package needs to be placed on a suitable flat surface. After unpacking, two people are required to take the product out of the package. One person is required to lift the long side of the package and place it in a suitable position. The position should support the weight of the product.

During laboratory use, two people are required to lift or handle the product if it is necessary to move it. Do not attempt to lift alone or use the two handles on the front panel to lift the product alone. See Figure 20 for the schematic diagram of standardized handling.

#### 5.5 Installation of handle

If the PRE20XXS series products need to be pushed and pulled in the cabinet, the handle in the "Installation Kit" can be installed according to Figure 23.

The PRE20XXS series products have been installed with foot mats by default. If you need to raise the product for use, you can replace the high foot mat in the "Mounting Kit" as shown in Figure 24.

The PRE20XXS series products support a wide voltage and frequency range. Before connecting an AC power supply to the PRE20XXS product, you must check the type label on the device to verify that its AC input configuration matches the local grid. If the AC input voltage, phase and frequency do not match, do not connect a power supply to this product.

ACTION

### AC input connection 5.8

The product AC input connection must include a disconnecting device (external switch or circuit breaker). As part of the installation, the disconnecting means must be in the proper position to be reached and must be marked as the disconnecting means of the product. All conductors must be simultaneously disconnected by the disconnecting device.

It is necessary to provide external overcurrent protection devices (fuses, circuit breakers, and so on).

※言相意

The overcurrent protection device's breaking capacity must be appropriate for the rated current of the device.

On the supply side of the overcurrent protective device, there must be at least minimal insulation between supply connection components with opposing polarities.

Protective conductors cannot have overcurrent protective devices installed in them. The neutral line of multiphase products shall not be equipped with fuses or single-pole circuit breakers, and shall be installed in accordance with the requirements of GB19517-2009. For each model of PRE20XXS series product, please select the corresponding cable according to Table 5. **言記题** ACTIONPOWER

| PRE2020S      | 20 DOWER             | 380                            | 35                             | 50   | 6                                      |

The AC input connection must be on the AC input connector. The phase of the AC input is marked on the rear panel and requires a four-wire power connection (L1, L2, L3 and ground). The PRE20XXS series products adapt to the phase of AC input voltage. Unless there is a special need, it is not necessary to distinguish the three-phase phase correspondence. See Figure 25 for the wiring diagram.

Note: When installing the input connector, tighten the screws.

This product must be earthed through the AC input.

A well-grounded cable must always be used.

Grounding of electrical systems in accordance with applicable national standards must be observed. The grounding terminal is the screw-fastened port in the lower right corner of the AC input connector, see Figure 25.

### Load connection 5.9

Hazardous output: The product output is at a hazardous voltage level. The output is electrically isolated from the AC input power supply, so the output must always be considered hazardous. In all cases, when the AC input is connected to the product, the operator must disconnect the input of the PRE20XXS series before connecting or disconnecting the output connector.

All products can be configured for single-phase or three-phase output. The external voltage detection connector maintains the three-phase connection regardless of single-phase or three-phase operation. With the system TIONPOWER

configuration, the PRE20XXS series products automatically detect the channel and set it to the appropriate configuration.

#### 5.9.1 Output wiring and recommended wire diameter

The connection of the output terminals of the PRE20XXS series products to the load shall be made using the mating output connector provided. The connector is safe, the contact capacity is matched with the power output and must be used when connecting the load line.

Note: When installing the output connector, tighten the screws.

The load output cable has a certain derating relationship with the current size. For 40Hz-70Hz, it is recommended to select the corresponding wire diameter/wire gauge by referring to Table 6. The insulation withstand voltage rating of the load cable shall also be considered. Due to the skin effect, the same wire loss will increase with the increase of the output frequency. If the frequency exceeds 120Hz, it is recommended to use the output wire with reference to the standard derating.

Table 6 Output Wire Diameter/Wire Gauge@40Hz-70Hz

#### **Three-phase Y-load connection** 5.9.2

The three-phase and six-wire output of PRE20XXS series products are independent of each other. When butting Y-shaped load, the connection method is shown in Figure 26. NA, NB, NC are shorted to a neutral point which is the reference point for all phases. The PRE20XXS series products have been designed with an independent detection 后前1月間 ACTIONPOWER system, which does not need to be adjusted. CTIONPOWER

FIG.26 Schematic Diagram of Y-Load Connection

With the increase of AC output frequency, the load terminal voltage will decrease greatly. To obtain a more accurate voltage at the load port, adjust the remote compensation cable as described in 7.10.

#### Three-phase $\Delta$ -load connection 5.9.3

The three phase and six-wire output of PRE20XXS series products are independent of each other. When butting Δ-shaped load, the connection method is shown in Figure 27. The PRE20XXS series products have been designed with A AS an independent detection system, which does not need to be adjusted.

FIG.27 Schematic Diagram of Δ-Shaped Load Connection

### 5.9.4 Output neutral grounding

Ungrounded power output neutral terminal is equivalent to output midpoint suspension. The power supply allows its output to float relative to earth. The midpoint of the power supply can be earthed through the load. The output midpoint can also be connected to the grounding terminal on the rear panel of the power supply through a wire to obtain a stable grounding potential. The wiring method is shown in Figure 28.

Figure 28 Schematic Diagram of Output Midpoint Grounding

#### 5.9.5 Single phase / DC load connection

Although the internal space of PRE20 is very compact, two sets of devices, parallel switch and load switch, are still designed. The parallel switch is associated with single-phase mode, which can automatically parallel three-phase to A-phase outputs, reducing the operation complexity and solving the problem of protection when forgetting to remove external short-circuit wires. The load switch is associated with the OUT function, realizing the output and load isolation. making the R&D test and production line ATE conversion of the test object safer.

The three-phase and six-wire output of the PRE20XXS series products are independent of each other. Either one of the phases can be used, or the three phases can be connected in parallel to form a single phase/DC to extend the output capacity to the rated value. The PRE20XXS series products have been designed with an independent detection system, which does not need to adjust the detection system or set the current detection multiplier. ACTIONPOWER

**※**言記書

<50A rms

Figure 29 Wiring Diagram of Single-phase/DC Load with Current J Figure 30 Wiring Diagram of Single-phase/DC Load with Current ≥50A rms

Note: 1. The N line of all wiring modes must be short-circuited.

2. It is necessary to switch from three-phase mode to single-phase/DC mode after correct wiring as shown in the diagram. See Section 8.2 for details.

## 5.10 Installation of Energy Matrix Interface

When the PRE20XXS series products are parallel, the outputs shall be short-circuited and the optical fiber cable shall be used for communication. This product only opens the Energy Matrix interface on the left side. Take 3 PRE20XXS series products in parallel as an example. The optical fiber connection method is shown in Figure 31. Insert the optical fiber cable into the optical module, fasten the optical fiber module, and then insert the optical fiber module into the Energy Matrix interface of the product.

\* 言和見

# 5.11 Installation of Anyport Interface

Anyport is a flexible user interface. An analog programming converter can be connected to this interface to use it. It is necessary to disconnect the power input before connecting or unplugging the Anyport interface. The installation method of Anyport is shown in Figure 32.

When placing the product on the bench or table, ensure that the maximum rated capacity of the bench/table is greater than the actual weight of the product.

The PRE20XXS series products are equipped with instrument pads at the bottom to prevent sliding damage to the desktop when used on the desktop. However, do not push the product forcibly when moving, to prevent the rubber parts CTIONPOWER of the instrument pad from falling off and damaging the desktop.

## 5.13 Rack mounting

The PRE20XXS series products can be installed in standard 19-inch racks. Customers/system integrators who want to install one or more PRE20XS series products in their systems can order the PRE20XXS dedicated rack directly. The rack is equipped with input and output terminals and has reserved L-shaped support mounting space for zero stacking with other devices or test equipment. Xi'an ACTIONPOWER Electric Co., Ltd. can provide corresponding technical support.

## 5.14 Ventilation

The PRE20XXS series products adopt the design of front panel air inlet and rear panel air outlet. In order to ensure the normal operation of the product, there shall be no obstacle 30cm away from the rear panel to block the outlet air flow during installation of the PRE20XXS series products to prevent overheating.

## 5.15 Noise level

When the product is running at or near rated full power in high temperature environment, the fan speed will reach its maximum. The noise level of the power supply may exceed 70 dB at a distance of 1 m from the front panel of the power supply. The installer shall provide measures to reduce the noise level at the point of use by the operator to a safe level. These measures may include the installation of noise reduction baffles or the provision of protective earplugs. Operators ACTIONPOWER should wear ear protection when exposed to these levels of noise.

Caution

ACTION

## 5.16 Liquid Prevention

PRE20XXS series products have no liquid spillage protection. Do not install it in areas where chemicals or liquids ACTIONPOWER ACTIONPO may spill.

## 5.17 Cleaning

PRE20XXS series products have no user cleaning design or cleaning accessories, and can be used for a long time in the recommended environment. If necessary, please contact the manufacturer for after-sales service.

## 5.18 Handling of abnormal conditions

ACTIONPOWE

In the unlikely event of product failure, or if the power supply cannot be turned on even if the correct AC power supply is connected, please attach a warning label to the power supply to indicate that maintenance or repair is required. Contact Xi'an ACTIONPOWER Electric Co., Ltd. or its authorized representative to arrange services. 后间 月 日

※言和夏

ACTION

## 6 Front Panel

## 6.1 Front panel layout

The PRE20XXS series products are designed with an integrated panel. At the same time, the operation functions are distributed according to the principle of frequency of use and operation habits. The key function is placed at the lower left and the rotation function is placed at the upper right, which greatly speeds up the operation efficiency and improves the precision. The division of the operation functions takes into account the left-handed and right-handed users at the same time, so that each operator can be comfortable.

The functional partition of the front panel is shown in Figure 33, including display screen, manufacturer LOGO, external storage interface, power/reset button, output button, left shuttle knob, left shuttle button, right shuttle knob and right shuttle button.

| ICNPOWER   | ACTICAL                    |

#### 6.1.1 Display Screens

PRE20XXS series products use 8.8 inches, 1920\*480 resolution, 16-bit RGB ultra-large aspect ratio LCD touch screen, which can display more information. The user can operate the controls by touching the display and physical keys.

#### 6.1.2 Manufacturer LOGO

The manufacturer's LOGO has the function of indicating the product status. When the PRE20XXS series products are powered on, the LOGO will be lit up in red. The upper left corner is the company logo, the right side is the product series name PRE, and the bottom is the full name of the product PROGRAMMABLE POWER SUPPLY, that is, bidirectional AC programmable power supply.

#### 6.1.3 External storage interface

This interface is used for external USB storage device, which can access and exchange the information of internal and external USB storage devices of PRE20XS series products.

#### 6.1.4 Power/reset button

The power/reset button is the ON, OFF and reset button for PRE20XXS series products, with tri-color indicator lamp function. Yellow for standby, green for normal operation and red for protection.

※言相意

### 6.1.5 Output button

The output button is a button to turn on or off the output terminal. When the button indicator is not on, it indicates CTIONPOWER

ACTIONE

|        | INPOWER  | AL                 |                                       |

that the output terminal is inoperable; when the button indicator is green, it indicates that the output terminal is disconnected; when the indicator is red, it indicates that the output terminal is connected.

### 6.1.6 Left/right shuttle button and knob

The backlight of the left/right shuttle button is off by default. The backlight is on when the shuttle button is pressed, and the shuttle knob at the corresponding position is enabled. After no operation for 5s, the shuttle button backlight will be automatically extinguished, and the shuttle knob function at the corresponding position will be invalid.

The left/right shuttle knobs are used to set the values on the right side of the main screen of the display. The left shuttle knob sets the output voltage and the right shuttle knob sets the frequency. The user can set the desired value by using the shuttle knob instead of the on-screen numeric keypad. Rotating the left/right shuttle knob clockwise increases the value and rotating it counterclockwise decreases the value in steps of 1.

## 6.2 Operation related to power/reset button

X STIDNPOWE

The power/reset button can realize three functions: power on, off and reset.

### 6.2.1 Power On/Off

The power-on operation of the PRE20XXS series products is as follows:

Step1: Turn the rear panel AC circuit breaker upwards to ON, as shown in Figure 34, State 1;

※ 完計調算

Step2: Wait for the front panel manufacturer's LOGO to light up, and the power/reset button indicator light turns yellow. At this time, it is the standby state, as shown in Figure 34, state 2;

Step3: Press and hold the power/reset button until the indicator light turns green, see Figure 34, status 3, that is, the product is turned on.

※着相意 ACTIONPOWN

| <mark>状态 2</mark> | State 2                   | Action        |
| <mark>状态 3</mark> | State 3                   |               |

The shutdown operation of the PRE20XXS series products is as follows:

Step1: Disconnect the output terminal, see Figure 35, State 1;

Step2: Press and hold the power/reset button until the indicator light changes from green to yellow, see Figure 35, State 2;

Step3: Turn the rear panel AC circuit breaker down to OFF, see Figure 35, status 3, that is, the product shutdown is completed.

Although the PRE20XXS series is a feedback device, it has anti-islanding function. In an emergency, when energy is fed back to the grid through the product, it can still be shut down by directly disconnecting the AC terminal circuit breaker. However, it is usually recommended to follow the above shutdown steps.

#### 6.2.2 Automatic start-up

PRE20XXS series products have automatic startup function, which simplifies the startup steps and is convenient for users.

The automatic start-up shall set the starting mode of the product to be automatic, as detailed in Section 8.13.

#### 6.2.3 Reset

The reset operation of the PRE20XXS series products is as follows:

Step1: The power/reset button indicator turns red and the status display area shows the protection status, see Figure 36. State 1:

Step2: Press the power/reset button briefly and the output button indicator starts to flash. The reset action is completed until the power/reset button indicator and output key indicator turn green, and the status display area changes from the protection state to the standby state, as shown in Figure 36, State 2.

※ 完計算情

#### 6.3 Output button-related operation

The output button is a button to turn on or off the output terminal. When the button indicator is not on, it indicates that the output terminal is inoperable; when the button indicator is green, it indicates that the output terminal is ACTIONPOWE disconnected; when the indicator is red, it indicates that the output terminal is connected.

#### 6.3.1 Manual output

The output operation of the PRE20XXS series products is as follows:

Step 1: The power supply is in standby state, see Figure 37, state 1:

Step2: Press the output button, the output relay is engaged, and the indicator lamp of the output button changes from green to red, as shown in Figure 37, State 2. At this time, the output terminal of the product is connected;

Step3: Press the output button again, the output relay is disconnected, and the output button indicator lamp changes from red to green, as shown in Figure 37, State 3, and the output terminal of the product is disconnected at this time.

#### 6.3.2 Automatic output

The PRE20XXS series products have the function of automatic output. When the product operation mode is set to automatic, as shown in Section 8.13, the product will automatically output according to the parameter settings saved last time after startup.

#### 6.3.3 Output on/off delay

PRE20XXS series products have the functions of output on-time delay and off-time delay.

When setting the on-delay time of the product, see Section 8.13 for details. In the standby state, after pressing the output button, the indicator light of the output button turns from green to yellow, as shown in State 2 of Figure 38. After the set on-delay time, the output relay is closed, and the indicator light of the output button turns from yellow to red, as shown in State 3 of Figure 38. At this time, the output end of the product is connected.

※言相意!!

ACTIC

When the product disconnection delay time is set, see Section 8.13 for details. In the output state, after the output button is pressed, the output button indicator turns from red to yellow, as shown in State 2 of Figure 39. After the set disconnection delay time, the output relay is disconnected, and the output button indicator turns from yellow to green, as shown in State 3 of Figure 39. At this time, the output end of the product is disconnected.

In Figure 40, T1 is the time from pressing the output button to the closing of the output relay, which will be affected by many factors such as on-time delay parameters and response delay, and the minimum time is 100ms. A

### 6.3.4.2 Output disconnection sequence

See Figure 41 for the output disconnection sequence.

In Figure 41, T1 is the time from pressing the output button to disconnecting the output relay, which is affected by various factors such as shutdown slew rate, shutdown angle and disconnection delay parameter. The output voltage has dropped to zero before the output relay is disconnected.

The rear panel of PRE20XXS series products provides a simple and standard interface. This chapter introduces the layout of the rear panel and matters needing attention in use.

### 7.1 Rear panel layout

The rear panel includes Anyport interface, Energy matrix interface, USB communication interface, LAN interface, log storage interface, output measurement interface, output connector, optional interface, remote compensation interface, input connector, PE connector and AC input circuit breaker, as shown in Figure 42.

## 7.2 Anyport interface

Anyport is a multi-functional interface, which has four types: digital input, digital output, analog input and analog output. By configuring the corresponding functions of this interface, users can operate and monitor the product's status. 6-channel digital input interfaces and 6-channel digital output interfaces can be independently configured to realize different demand control. See Figure 43 for the functions of digital input and digital output interfaces.

#### 7.3 Energy Matrix Interface

Energy Matrix is an energy matrix interface, which is a unique parallel function of this product, and can realize the parallel expansion of 10 products to 200kVA capacity. The general parallel system will have uneven flow after parallel expansion, and the maximum output capacity of the system will be less than the product of the single machine capacity and the number of parallel connections. With the increase of the number of parallel systems, this situation will become ACTIONPOWER

※言記書

ACTION

more and more obvious. The Energy Matrix interface of this product can provide an uneven fluidity of less than 0.02%. with almost no loss of capacity.

ACTION

## 7.4 USB interface

The USB interface is used for remote control. It is a Type-B interface, which supports two types of USB2.0 and USB1.1, and includes two protocols, namely USBTMC and USB488. The transmission rate can reach 480Mbps. In order to ensure the communication reliability, the length of the connecting line is not allowed to exceed 2m, and both SCPI and Modbus-RTU protocol instruction sets are supported. See PRE20 series bidirectional AC programmable power supply programming guide for details.

Note: USB and LAN interfaces can receive inquiry instructions at the same time, but only one control instruction can be selected

#### 7.5 LAN interface

Remote control is accomplished through the LAN interface. Standard RJ45 interface, port number is 502. Support SCPI or Modbus-TCP two protocol instruction sets. See PRE20 series bidirectional AC programmable power supply programming guide for details.

Note: USB and LAN interfaces can receive inquiry instructions at the same time, but only one control instruction can be selected.

※言和意

## 7.6 Log storage interface

The log storage interface can be connected with an external USB storage device to import/export the contents of the log interface. See Section 8.11.2 for specific operations.

#### 7.7 Output measurement interface

PRE20XXS series products are designed with a standard 4mm banana socket, which can be adapted to various types of measuring instruments to quickly measure the output end voltage. ACTION

#### 7.8 Output connector

The output connector is the output end of PRE20XXS series products. In all cases, when the AC input is connected STICLES IS ACTIO

to the product, the operator must disconnect the input of the product before connecting or disconnecting the wiring of the output connector.

《晋和唐

ACTION

## 7.9 Optional interface

Optional interface can expand the functions of PRE20XXS series products, which can be used in different industries. Users can refer to the Magic-Box/Magic-Bus manual to select the required expansion components. The optional interface has two card slots, both of which can automatically identify Magic-Box/Magic-Bus functional components, but only one Magic-Box and one Magic-Bus can be installed, and two Magic-Boxes or Magic-Buses with different functions cannot be identified.

### 7.10 Remote compensation interface

※ 言而意他 ACTIONPOWE

The remote compensation interface of PRE20XXS series products has the function of remote compensation voltage, which can directly compensate the voltage drop on the line from the output end to the external load. The value displayed on the display screen is calculated by sampling from the compensation interface, so the remote compensation cable must always be connected to the output end or the user load end.

With the increase of AC output frequency or output power, the terminal voltage of load may decrease. If you want to obtain more accurate voltage at the load port, please use the remote compensation cable, and the user can connect it by himself as required. See Figure 46 for the connection mode.

One end of the compensation cable is connected to the "sampling end" and the other end is connected to the "user load end" according to the corresponding phase sequence, and the remote compensation function is automatically enabling.

※言記意

※着記意連 ACTIONPOWE

| 术任师              | Sampling end  |
|------------------|---------------|
| 用户负载端            | User load end |
| 采样端              | Sampling end  |
| <mark>输出端</mark> | Output end    |

The requirements for remote compensation cables connected by users themselves are as follows:

For the line compensation cable with a length of less than 5m, the cross-sectional area is suggested to be 0.5mm<sup>2</sup>; The compensation line shall be twisted;

In parallel mode, the compensation line only needs to be connected to the host product;

The dielectric strength of the compensation line must at least meet the rated DC voltage of 636 V;

## 7.11 Input connector

The input connector is the AC input end of PRE20XXS series products, which can be directly connected to the power grid. Before connection, be sure to turn the input circuit breaker to the OFF position.

## 7.12 PE connector

PE connector is the ground terminal of PRE20XXS series products. In order to ensure personal and product safety, PE connector must always be connected to the ground.

ACTION

X STIDNPOWE

## 7.13 AC end circuit breaker

The AC-side circuit breaker is an important switch connecting the PRE20XXS series products with the network side, which has the functions of overload and short circuit protection. When the circuit breaker at the AC end is turned ON, it will be powered on, and when it is turned OFF, it will be powered off. When not using this product, be sure to turn the circuit breaker to the OFF position.

## 8 Display screen function and operation

ACTION

爱利意

All parameter settings and functional applications of PRE20XXS series products can be realized by operating the front panel display screen, and the functional interface of the display screen is divided into 16 parts, as shown in Figure 47. You can swipe left and right or up and down in each function interface to view related content.

### 8.1 Main Interface

The main interface, as shown in Figure 48, is divided into the following five areas: menu operation area, status display area, output display area, drop-down shortcut area and output setting area. Different areas can achieve different functions, and users can quickly obtain the required information in these interfaces.

### 8.1.3 Output display area

The output display area is the display area of product output parameters, which is divided into four pages, namely, output basic parameters display page, output detail parameter display page, voltage/current distortion rate digital display page of voltage/current distortion rate column display page. Swipe left and right in this area to see the corresponding content.

### 8.1.3.1 Output basic parameters display page

The display page of output basic parameters is shown in Figure 51. See Table 9 for the definition of each parameter.

Figure 53 Digital Display Page Diagram of Voltage/Current Distortion Rate

### 8.1.3.4 Voltage/current distortion rate column display page

The column display page of voltage/current distortion rate is shown in Figure 54. This page displays the histogram of 2-50 harmonic content of output voltage/current.

Figure 54 Page Diagram of Voltage/Current Distortion Rate Column Display

#### 8.1.4 Drop-down shortcut area

The drop-down shortcut area provides some basic operations, which can improve the user's operation efficiency, and the same function can still be operated in the corresponding menu items. The function options in the drop-down shortcut area are temporarily not supported for adjustment or modification.

※ 后和夏

Users can click the middle button at the top of the screen to open the drop-down shortcut area, and click the button X at the top right to close the drop-down shortcut area. See Figure 55 and Table 11 for the established functions.

Figure 55 Drop-down Shortcut Area Map

|                          | rigule 55 Diop-down on order Area map   |
|--------------------------|---|
| Table 11 Functions o     | f Shortcut Area   |
| Button                   | Interpretation and operation  |
| Alarm tone               | Click this button when the protection/alarm/event signal sound prompt is needed, and the alarm sound prompt will sound when the product screen displays the status.                     |
| Local<br>control/LAN/USB | Click this button to quickly switch communication ports.  |
| Screen lock              | Click this button when you need to prevent misoperation or lock the screen. Click this button again and the screen lock function will be released.                                      |
| Local lock               | When it is necessary to prevent the remote command from modifying the control right, click this button, and the product can only allocate the control right through the display screen. |
| Clear event              | Clear the events and status that have occurred.   |
| List 🏹                   | Quickly jump to the programming interface or the corresponding functional interface.  |
|                          |   |

#### 8.1.5 Output setting area

The output setting area can set the output voltage and frequency. Click the numerical value and enter the desired parameters in the right numeric keypad, as shown in Figure 56 and Figure 57. You can also use the left/right shuttle to set the parameters. See Section 6.1.6 for details. CTIONPOWER

※言和夏

#### 8.2 Mode

Click Mode in the menu bar to enter the mode setting interface. In the mode setting interface, you can select the output phase number, coupling mode, output waveform and the percentage of waveform of PRE20XXS series products. See Figure 58 for the setting interface.

Figure 58 Mode Setting Interface Diagram

Click the arrow to the right of "Select Waveform" to enter the waveform selection interface, as shown in Figure 59, which provides not only common sine wave, pulse wave, triangle wave, clipping wave and pulse wave, but also 30 kinds of harmonics, and opens 100 kinds of user-defined waveforms. Users can get the required waveforms by setting the percentages of pulse wave, triangle wave, clipping wave, leading half wave and trailing edge half-wave. See Table 12 for the percentage interpretation.

### 8.3 Parameters

Click Parameters in the menu bar to enter the parameter setting interface. The parameter setting interface includes the parameter setting and function configuration related to product output.

The relevant parameter settings of product output include AC/DC output voltage, phase and frequency; Functional configuration includes AC limit, DC limit and internal resistance; You can also set the slope, response speed, slew rate, angle, impact current and external synchronization delay.

Figure 60 Parameter Setting Interface Diagram

※ 元 TIONPOWER

See Figure 61 for the interface of AC limit enabling.

Note: When paralleling, the relevant parameter settings of current and power need to be multiplied by the number of paralleling. 后前 易問

## Programming 8.4

PRE20XXS series products are designed with five programming modes. Through flexible configuration parameters, the required waveform can be edited. See Figure 65 for programming functions. All programming modes must be used ACTIC when the product has been exported.

Click Programming -List- Edit in the menu bar to enter the List programming interface, and you can set the list programming parameters yourself, as shown in Figure 67. See Table 14 for the definition of each parameter.

| Uac[V]                          | 100          | 250  | 50   |
| Freq[Hz]                        | 50 <b>50</b> | 50   | 50   |
| Dwell[s]                        | 0.1          | 0.1  | 0.1  |

See Figure 68 for an example of List programming.

※言和意思

Note:At any time when the programming mode is running, you can click "Exit" to end the current programming mode.

Click Programming -List- Configuration in the menu bar to enter the list mode configuration interface, as shown in Figure 71.

※完和意情

Figure 71 List Configuration Interface Diagram

The configuration interface can change the number of cycles of the programming waveform. If the number of cycles of the List programming waveform is set to 2, the programming waveform is shown in Figure 72.

Note:At any time when the programming mode is running, you can click "Exit" to end the current programming mode. Click Programming -Pulse- Configuration in the menu bar to enter the Pulse mode configuration interface. The ACTIONPOWER ACTION

※完相意情

parameters and functions of the Pulse configuration interface are the same as those of the List mode configuration interface, as shown in Figure 71.

The configured Pulse programming waveform data can be stored in the product interior or in an external USB storage device, which is convenient for direct calling next time, so as to reduce the repeated configuration operation of users. See Section 8.11.5 for details.

The specific method of storing Pulse programming waveform data into the product interior can refer to the storage method of List programming.

## 8.4.5 Advanced

Advanced includes editing and configuration, as shown in Figure 94.

Click Programming -Advanced- Editing in the menu bar to enter the Advanced programming interface, where you can set advanced programming parameters by yourself. Slide left and right in the interface to see the complete programming parameters, as shown in Figure 95 and Figure 96. See Table 23 for the definition of each parameter.

| Parameter term | Unit | Interpretation  | Model | Resolution | Setting<br>range |

Click Programming-Advanced-Configuration in the menu bar to enter the Advanced mode configuration interface. The parameters and functions of the Advanced configuration interface are the same as those of the List mode configuration interface, as shown in Figure 71.

The configured Advanced programming waveform data can be stored inside the product or to an external USB storage device to facilitate direct call next time to reduce the repeated configuration operation of the user. See Section 8.11.5 for details.

For the specific method of storing waveform data of Advanced Programming into the product, please refer to the ACTIONPOWE ACTION storage method of List Programming.

#### 8.5 Harmonics

Harmonic includes editing and configuration, as shown in Figure 104.

Click Harmonic-Edit in the menu bar to enter the harmonic parameter setting interface. You can set harmonic parameters and output them yourself, or output 30 kinds of harmonics built in the product. See "Appendix-Built-in ACTIONPOW CTIONPOWER

※言和夏

Harmonic Examples" for waveforms. The harmonic parameter setting interface is shown in Figure 105. See Table 25 for the explanation of each parameter. -

Note: 1. At any time during harmonic operation, you can click "Exit" to end the current mode.

2. After modifying the harmonic parameters, "Update" is highlighted and click "Update". The product will output the waveform according to the harmonic parameters currently set.

3. How to use "Export Waveform": click "Export Waveform"  $\rightarrow$  enter the name of the saved waveform  $\rightarrow$  click "Enter"  $\rightarrow$  click  $\varphi 1/\varphi 2/\varphi 3$  to export, that is, to store the currently edited waveform to the product.

The configured harmonic parameters can be stored inside the product or to an external USB storage device for direct call next time to reduce repeated configuration by users. See Section 8.11.5 for details.

For the specific practice of storing harmonic parameters inside the product, refer to the storage method of List programming.

Click Interharmonic-Edit in the menu bar to enter the interharmonic parameter setting interface, where you can set the interharmonic parameters by yourself. See Figure 112 for the interharmonic parameter setting interface. The parameters are explained in Table 27.

Figure 112 Interharmonic Parameter Setting Interface

| Triggering        | 1        | From the stable output state to the programming waveform output state.  | ALL           | gwen       | 1             |  |

Note: The expected output waveform is still limited by the value parameters, and improper limit setting may distort the expected output waveform.

Example of setting interharmonic parameters:

- 1) Press the output button on the front panel to let the product output a steady-state voltage.
- 2) The interharmonic parameters are shown in Table 28.

Figure 116 Interface of Interharmonic Configuration

Refer to List and Harmonic Configuration Interface for parameter functions and interpretation in the interharmonic configuration interface.

The configured interharmonic parameters can be stored inside the product or to an external USB storage device to facilitate direct call next time to reduce repeated configuration by the user. See Section 8.11.5 for details.

For the specific practice of storing interharmonic parameters inside the product, refer to the storage method of List programming.

Click the limit in the menu bar to enter the limit setting interface. The limit setting interface is shown in Figure 117, where the given range of voltage, frequency, current and power can be set. See Table 29 for the definition of limit parameters.

#### 8.9 Event

※ 着 和 E TIONPOWER

The PRE20XXS series products are designed with event logging function, which can monitor specific situations that occur during operation and facilitate users to observe and understand the working condition of the product. Click event in the menu bar to enter the event setting interface. The event setting interface is shown in Figure 119. A

Note: 1. When do 1 is single-phase, the corresponding parameters of current and power shall be multiplied by 3.

2.  $\phi$ 2 and  $\phi$ 3 are invalid in single phase, and refer to  $\phi$ 1 for other corresponding parameters.

3. During parallel operation, the corresponding parameters of current and power shall be multiplied by the number of parallel operations.

※完計算個

Example: The parameter settings of Event 1 are shown in Table 33.

| A schematic diagram of the triggering of Event 1 is shown in Figure 121. The holding time of T1 is less than the |                       |                  |             |        |  |  |  |

triggering time, so event 1 is not triggered; The holding time of T2 is equal to the trigger time, so event 1 is triggered at 4s.

# 8.10 Communication

The PRE20XXS series products can be switched between local and remote communication modes, and the remote supports LAN and USB communication with user equipment. Click Communication in the menu bar to enter the communication setting interface. In the communication setting interface, you can choose to transfer the control of this product to different ports for local/remote control. The communication interface is shown in Figure 122. See Table 34 for the explanation of parameters.

# 8.10.1 LAN Interface IP Assignment

## 8.10.1.1 Automatic mode

In automatic mode, in a LAN with a DHCP server, the PRE20XXS series products will request network parameters from the server through the DHCP protocol, and the request timeout is 30s. The network topology is shown in Figure 后前:時間 ACTIONPOWER

※言相寫!

In a LAN without a DHCP server or after a DHCP request times out, the PRE20XXS series products will automatically allocate network parameters via the AutoIP protocol. The network parameters automatically allocated by AutoIP are shown in Table 35. The network topology is shown in Figure 124. A

Table 35 Network Parameters Automatically Assigned by AutoIP

| TA T   |
| In the second se |
|  |

※完計算個

The network parameters obtained in automatic mode are not saved, and the network parameters will be retrieved every time the network cable is inserted or switched to automatic mode.

## 8.10.1.2 Manual mode

The network parameters in manual mode are set by the user on the LAN configuration page. When used in the LAN, if the IP address set is the same as that of other network devices, the setting cannot take effect. After the IP conflict, the PRE20XS series products will automatically assign a new IP address through the AutoIP protocol. Manual mode is applicable to various network topologies.

※言和意

## 8.10.1.3 LAN Status Description

The description of LAN status display is shown in Table 36.

Table 36 Interpretation of LAN Status Display

| Status           | Status Interpretation                    |  |
|------------------|--|--|
| Fault            | No network cable inserted or IP conflict |  |
| Device Identity  | In network configuration                 |  |
| Normal Operation | Configuration successful                 |  |
| 8.10.2 USB inter | rface configuration                      |  |

# 8.10.2 USB interface configuration

## 8.10.2.1 Interface Description

The description of the USB interface is shown in Table 37.

Table 37 Description of USB Interface

| Category         | Support                       |  |
|------------------|-------------------------------|--|
| Connector type   | USB Type B                    |  |
| Hardware support | USB 2.0, USB 1.1              |  |
| Protocol Type    | Class USBTMC, Subclass USB488 |  |
| Driver           | NI-VISA Driver                |  |

## 8.10.2.2 Use

After the computer has successfully installed the NI-VISA driver, connect the computer and the PRE20XXS series products through a USB cable, and identify the device information in Figure 125 in the computer's device manager, and the software and hardware work normally.

**USB** Test and Measurement Devices

USB Test and Measurement Device (IVI)

Figure 125 USB Information Diagram in Device Manager

After successful identification, SCPI commands can be sent to the PRE20XXS series products through NI-MAX software. When the query command is sent, the interval between the DEV DEP MSG OUT message (Write) and the REQUEST DEV DEP MSG IN message (Read) must be more than 10 ms.

## 8.11.1 Information

Click Storage-Information in the menu bar to enter the information interface. The information interface is to record the operation status of the PRE20XXS series products, including operation, protection, alarms and events, as shown in Figure 127.

Figure 135 Interface Diagram of External USB Storage File

File interaction between internal storage and external USB storage devices can be realized through copy/paste in the file interface.

# 8.12 Parallel connection

When the PRE20XXS series products are connected in parallel, it is necessary to connect the parallel optical fiber cable correctly, see Section 5.10 for details, and then click Parallel in the menu bar to enter the parallel interface, and set 后前日 ACTIONPOWER the master/slave in the parallel interface in Figure 136. TIONPOWER

Click Advanced in the menu bar to enter the advanced setting interface. The advanced setting interface is shown in Figure 140, which provides the user with the ability to set the on/off delay time, operation and start mode, the function options of the shuttle and the calibration parameters of the product. The meaning of each parameter is shown in Table 40. This product provides calibration function, users can calibrate by themselves or contact the after-sales factory for calibration.

The calibration consists of voltage calibration and current calibration. Before calibration, short-circuit the N-wire at the output end of the product, and then perform the calibration as follows.

1. Voltage calibration

The product does not require external loads and all protection parameters are set to their maximum values, see Section 8.8. Connect a voltmeter with precision less than 0.01% to the output measurement interface of the rear panel, adjust it to the DC gear, and set the coupling mode of the product to three-phase DC. Set the voltage values to +600V, ACTIONPOWER

※言和夏

-600V and 0V respectively and output, record the voltmeter display value and product display value of each phase (i.e. one group), calculate the voltage slope and voltage intercept of each phase with three groups of data of each phase, and fill in the corresponding positions in Figure 140, that is, complete the voltage calibration.

ACTION

#### 2. Current calibration

Set all protection parameters to their maximum values after the product is externally loaded, see Section 8.8 Connect an ammeter with precision of 0.1% below to the output terminal, adjust it to DC gear, and set the coupling mode of the product to three-phase DC. Set the voltage value to +100V, output +30A, -30A and 0A respectively, record the ammeter display value and product display value of each phase (i.e. one group), calculate the current slope and current intercept of each phase with three groups of data of each phase, and fill in the corresponding positions in Figure 140, that is, complete the current calibration.

After completing the voltage calibration and current calibration, press and hold the power/reset button to turn off the machine, and the calibration parameters have been saved after turning it on again.

NOTE: If you press Reset Calibration, the above calibration parameters are cleared to zero. To save, press and hold the power/reset button again to shut down.

## 8.14 Anyport

Anyport consists of both digital and analog parts, see Figure 141. Each enable switch corresponds to one Anyport interface pin, and pay attention to one-to-one correspondence during use.

## 8.14.1 Number

Click Anyport - Number in the menu bar to enter the number setting interface.

## 8.14.1.1 Digital input

The Anyport digital input setting interface is shown in Figure 142, which can realize the external given enable, trigger, interlock, start-stop, reset, emergency stop and external synchronization input functions under positive/negative polarity. The digital input functions are detailed in Table 41.

The Anyport digital output interface is shown in Figure 143, which can realize the functions of interlocking, triggering, voltage indication, current indication, general I/O and external synchronous output under positive/negative polarity, and can also monitor the operating status, CV status and protection status of the product. The digital output functions are ACTIONPOWER detailed in Table 42.

| Interface type | Interface name     | Functional Interpretation                              |
|----------------|--------------------|--|
|                | Input 1[           | Tracking amplitude                                     |
|                | Input 2[cp2 Port8] | Tracking effective value                               |
| Analog input   | Input 3[dp3 Port7] | Real-time tracking                                     |
|                | Input 4 [Freq      | Tracking frequency: only the source mode is supported. |
|                | Port6]             | making requeries, only the source mode is supported.   |

(1) Tracking amplitude:

1) When the coupling mode is AC or AC+DC, the following equation can be used:

5V range: Peak value of output sine wave = Vref(dc)/5V(dc)×450V(ac)×1.414

10V range: Peak value of output sine wave = Vref(dc)/10V(dc)×450V(ac)×1.414

Example: If a sine wave with a peak value of 300V is required to be output with a 5V range, the external

given voltage Vref is 2.357V(dc).

If a sine wave with a peak value of 300V is required to be output with a 10V range, the external given voltage Vref is 4.715V(dc).

When the external setting is less than 0, the outputs are all 0.

2) When the coupling mode is DC, the following formula can be used:

5V range: Vout=Vref(dc)/5V(dc)×636V(dc)

10V range: Vout=Vref(dc)/10V(dc)×636V(dc)

Example: When using the 5 V range, if a Vout of 300 V is required, the external given voltage Vref is 2.358 V (dc). If Vout is required to be -300 V, the external given voltage Vref is -2.358 V (dc). When using the 10 V range, if a Vout of 300 V is required, the external given voltage Vref is 4.717 V (dc). If Vout is required to be -300 V, the external given voltage Vref is -4.717 V (dc).

Tracking effective value

 When the coupling mode is AC or AC+DC, the following equation can be used: 5V range: effective value of output sine wave = Vref(dc)/5V(dc)×450V(ac)
 10V range: effective value of output sine wave = Vref(dc)/10V(dc)×450V(ac)

Example: When using the 5V range, if it is desired to output a sine wave with an effective value of 300V. the external given voltage Vref is 3.333V(dc).

If a sine wave with an effective value of 300V is required to be output with a 10V range, the external given voltage Vref is 6.667V(dc).

When the external setting is less than 0, the outputs are all 0.

When the coupling mode is DC, the following formula can be used: 2) ACTIONPC 5V range: Vout=Vref(dc)/5V(dc)×636V(dc)

10V range: Vout=Vref(dc)/10V(dc)×636V(dc)

Example: When using the 5 V range, if a Vout of 300 V is required, the external given voltage Vref is 2.358 V (dc). If Vout is required to be -300 V, the external given voltage Vref is -2.358 V (dc). When using the 10 V range, if a Vout of 300 V is required, the external given voltage Vref is 4.717 V (dc). If Vout is required to be -300 V, the external given voltage Vref is -4.717 V (dc).

ACTION

#### Real-time tracking (3)

It can be calculated using the following equation:

5V range: Vout=Vref(dc)/5V(dc)×636V(dc)

10V range: Vout=Vref(dc)/10V(dc)×636V(dc)

Example: When using the 5 V range, if a Vout of 300 V is required, the external given voltage Vref is 2,358 V (dc). If Vout is required to be -300 V, the external given voltage Vref is -2.358 V (dc).

When using the 10 V range, if a Vout of 300 V is required, the external given voltage Vref is 4.717 V

(dc). If Vout is required to be -300 V, the external given voltage Vref is -4.717 V (dc).

(4) Tracking frequency

When the coupling mode is AC or AC+DC, the following equation can be used: CTIONPOWER

兴后和夏

5V range: Freq = Vref(dc)/5V(dc)×200Hz

10V range: Freq= Vref(dc)/10V(dc)×200Hz

Example: When using a 5V range, if the output frequency Freq is 50Hz, the external given voltage Vref is

AGTIONPC

1.25V.

When using the 10V range, if the output frequency Freq is 50Hz, the external given voltage Vref is

ACTION

#### 2.5V.

## 8.14.2.2 Analog output

The Anyport analog output interface is shown in Figure 146, and the analog input/output functions are shown in Table 44.

Figure 146 Interface Diagram of Analog Output Setting

Note: 1. When  $\phi$ 1 is single-phase, the corresponding parameters of current and power shall be multiplied by 3.

2.  $\phi$ 2 and  $\phi$ 3 are invalid in single phase, and for other corresponding parameter ranges, please refer to  $\phi$ 1.

3. During parallel operation, the corresponding parameter range of current and power shall be multiplied by the number of parallel operations.

※完計算個

Click the source load in the menu bar to enter the source load setting interface, as shown in Figure 147. The operating mode of PRE20XXS series products can be switched in the source load setting interface. After switching, the power mode status display will also change.

The functions and operation in load mode are described in Chapter 9.

# 8.16 System

The system consists of the Screen section and the About section, as shown in Figure 148.

※ 言記 ETIONPOWE

#### 8.16.1 Screen

Click System - Screen in the menu bar to enter the screen interface. Screen brightness, language, screen saver time, alarm tone and date time can be set in the screen interface, as shown in Figure 149.

Figure 149 Screen Interface Diagram

#### 8.16.2 About

Click System - About in the menu bar to enter the About interface. Equipment information and software versions of the PRE20XXS series products can be seen in the About interface, see Figure 150. The equipment information includes the product model, hardware version number, serial number of the machine, number of boots and running time ACTIONE A (whichever is actual).

※完計算個

※言和意情 ACTIONPOWER

The PRE20XXS series can also be operated in load mode. All functions and operations in load mode can be realized on the display, and each function interface can be swiped left or right or up and down to view relevant contents. This chapter mainly introduces part of the main interface, modes, parameters and limits in load mode, and the rest is ACTIONPOWER consistent with the source mode. See Chapter 8.

#### Source/load switching 9.1

For source/load switching, see Section 8.15. When switching, a prompt box appears, see Figure 151.

Figure 151 Source/load switching prompt interface diagram

The user can set the fast peak overvoltage threshold of the PRE20XXS series products according to the maximum withstand voltage of the device under test. Click "Settings" to enter the "Protection" interface, where the fast peak overvoltage threshold is set. If you click Ignore, the prompt box disappears.

#### 9.2 Main Interface

The load modes of the PRE20XXS series include CC, CP, RLC, and PQ, which can be selected in Section 9.3. When CC mode is selected, the main interface is shown in Figure 152.

※言和意

Time = run time. When the load timing in the Parameters screen in 9.4 is enabled, the timing time can be set, in which case Time indicates the run countdown. The output setting area can set the output current lac and the power factor PF. The status display area, menu buttons, output display area and drop-down shortcut area can refer to the main interface of source mode.

When CP mode is selected, the apparent power S and power factor PF can be set in the output setting area in the main interface

When RLC mode is selected, an RLC parameter setting page will be added to the main interface, as shown in Figure 153. Click the value to set the corresponding parameter. The basic parameters of RLC mode are shown in Table ACTIONPOWER
